

## Tailored Solutions for Intricate High Rise Systems

J&M Brown Company and Space Age Electronics have had a working partnership for 20+ years, therefore it was a no-brainer when approaching the One Congress project. The Bulfinch Crossing WPB2 Office Tower at One Congress Street is a mixed use office building which consists of forty three stories. The office tower soars 600ft into the Boston skyline, and is comprised of 1,000,000sq ft. of real estate.

The complex integration into the fire alarm system within this building is made up of both Space Age Electronics standard and custom solutions. These include fire alarm terminal cabinets, for cleaner and easier identification of circuit distribution of each high rise floor. Firefighters Smoke Control and Post-Fire Smoke Purge Panels, tailored assemblies using Space Age enclosures for fan and damper integration, mounting bracket solutions specific to fire alarm system monitoring as well as device brackets for sprinkler monitoring points.

*"This project was unique in the sense that it called for the interconnection of a residential tower, officer tower, and a parking garage with shared amenity space between the two. J&M Brown used Space Age Electronics ACE Cabinets and fast rail monitor module mounting system to house the control and monitor modules required to create this complex interconnection of three systems. The importance of utilizing prefabricated solutions like this is to save valuable time over other common field installation methods." - Bob Halloran | PM | J&M Brown Co.*
